

Start here

Running an NGA module on your own machine

You have cloned one NGA module. To run it:

Windows: double-click start.bat
Mac: in Terminal, run ./start.sh

That is the whole setup. The first run takes a few minutes: it installs packages, builds a local database, and fetches and starts your own copy of the **Central MIS**, the sign-in server every module uses. A second window opens for the MIS; keep it open. When both windows show their banner, open the address printed in your module's window.

Before the first run, make sure you have:

- **Node.js 20+** — nodejs.org (the LTS download)
- **Git** — git-scm.com
- **MySQL 8 or XAMPP** — Windows: start MySQL in the XAMPP Control Panel first; Mac: `brew install mysql && brew services start mysql`
- **Tupo only:** PostgreSQL 16 and Redis (Mac: `brew install postgresql@16 redis`)

If you are asked to sign in to GitHub during the first run, that is Git fetching the Central MIS. You need read access to its repository — ask your team lead if it is refused.

Sign in

Click **Sign In** in your module. It takes you to your own Central MIS at `http://localhost:5173`. The 6-digit code it then asks for is **printed on the login page** — no email is sent.

Every account uses the same password: Admin@1234

Each module has its own roles and works them out from the MIS account you sign in with. Pick the login for the role you want to see in **your** module:

Tendo — attendance & discipline

Tendo role	Sign in as	What you see
admin	superadmin or dev.admin	Admin dashboard, directory, rules, roles, audit log, all reports
teacher	dev.teacher or dev.classteacher	Mark attendance, log incidents, review excuses
student	dev.student	My conduct, my attendance, submit an excuse
unassigned	dev.accountant	The “pending — ask an admin” screen

TaskMentor — assignments, quizzes, proctoring

TaskMentor role	Sign in as	What you see
admin	superadmin or dev.admin	Everything: courses, students, question bank, reports
instructor	dev.teacher or dev.classteacher	Own courses, assignments, quizzes, grading
student	dev.student	Enrolled courses, attempts, own grades

Tupo — chat, mail, feed, meet

Tupo level	Sign in as	What you see
super_admin	superadmin	Every space, plus the admin area
program_lead	dev.programmanager	The program's spaces and its classes
class_teacher	dev.classteacher	The class's spaces
staff	dev.teacher or dev.admin	Staff spaces
student	dev.student	The class's student spaces
parent	dev.parent	Parent spaces for dev.student

Central MIS

Every account is exactly its MIS role: superadmin (SUPER_ADMIN), dev.admin, dev.headteacher, dev.teacher, dev.classteacher, dev.student, dev.parent, dev.accountant, dev.staff, dev.programmanager.

All accounts, all modules

The same MIS login lands as a different role in each module — this is each module's own mapping, measured, so you know what to expect. The MIS accounts are wired into the current academic year's main class: the teachers teach its subjects, the class teacher leads it, the student is enrolled, the parent is the student's parent, the program manager leads its program.

MIS account	MIS role	Tendo	TaskMentor	Tupo
superadmin	SUPER_ADMIN	admin	admin	super_admin
dev.admin	ADMIN	admin	admin	staff
dev.headteacher	HEAD_TEACHER	teacher	admin	staff
dev.teacher	TEACHER	teacher	instructor	staff
dev.classteacher	CLASS_TEACHER (+TEACHER)	teacher	instructor	class_teacher
dev.student	STUDENT	student	student	student
dev.parent	PARENT	student	student	parent
dev.accountant	ACCOUNTANT	unassigned	student	staff
dev.staff	STAFF	student	student	staff
dev.programmanager	PROGRAM_MANAGER	teacher	admin	program_lead

These accounts exist **only in the database on your machine**. Production has none of them, and their @nga.test emails cannot receive mail.

Running it again

Run `start.bat` (Mac: `./start.sh`) again. It skips whatever is already done and starts in seconds.

Something went wrong?

Read the window that shows the error — each message says what to do. The common ones:

It says	Do this
Could not clone the Central MIS	Your connection dropped, or you lack access. Run it again; ask your lead for access if it repeats
Installing ... failed twice	Connection dropped mid-download. Run it again
MySQL is installed but not accepting connections	Start MySQL (XAMPP Control Panel; Mac: <code>brew services start mysql</code>), then press a key in that window
Central MIS is still not answering	Look at the Central MIS window — the error is there
Redirect URI not allowed	Another program is using your module's port. Free it and run again — do not change the port

The full guide, including how to reset a database, is `LOCAL_SETUP.md` in the repo root.
